TITLE: An automatic telemetering system with FM transducers

SOURCE: AN SSSR. Institut elektromekhaniki. Sbornik rabot po voprosam elektromekhaniki, no. 9, 1963. Avtomatizatsiya, telemekhanizatsiya i priborostroyeniye (Automation, telemechanization and instrument manufacture), 226-233

TOPIC TAGS: transducer, telemeter, system telemetry, data transmission, data monitoring, monitoring sensor, transmission system, meteorology, commutator, sensor, transducer sensitivity, pulse counter, generator

ABSTRACT: A telemetering system which is required to monitor and transmit data from many sources is most economical when many monitoring sensors are used in connection with one measuring and transmitting system. A block diagram of such a system is shown in Figure 1 of the Enclosure. The majority of sensors used in meterology have transducers whose output electrical signal is varied either by voltage or impedance. These quantities are difficult to convert to digital form and usually require a physically moving commutator. When the sensor output is varied by frequency, proportional to the input variable, the reliability of the system increases since no moving contacts are required.

Card 1/5

ACCESSION NR: AT4015862

The FM transducers available are mostly nonlinear for the range

$$\frac{\Delta f_p}{f_{max}} \leq 0.2 f_{max} \quad (1)$$

where Δf_p is the operating frequency deviation of the sensor. Most non-linearities are of the form $f = k \cdot \sqrt{x}$. A compensation for the non-linear characteristic of the transducer element consists of multiplying the transducer output by a piecewise-linear approximation of the inverse of this non-linearity, so as to make the output of the measuring system of Figure 1 of the Enclosure directly proportional to the input variable. The block diagram of the measuring system is shown in Figure 2 of the Enclosure. The measurement is performed in two steps: determination of the number of the linearization segment and actual measurement with correction for non-linearity. For any element K, the timing system supplies a pulse which opens Gates 1 and 2. At the same time the inputs of two pulse counters are supplied with pulses at frequencies f_{rg} (reference generator) and f_k . When counter 1 is filled, it generates a pulse which closes both gates and signals the timing circuit that the first measuring stage is completed. The timing circuit forms a series of pulses required to read out from counter 2 a number which corresponds to the number of

Card 2/5

ACCESSION NR: AT4015862

the linearization segment. This number is used to select proper linearization constants (slope and intercept) from the block of constants in accordance with the number of the sensor element and the number of the linearization sector as recorded in both counters. As a result the counter 2 output gives a digital number N_k which corresponds to the magnitude of the measured variable in physical units. The block of constants is the most complex part of the system. A simple realization is given using ferrite-diode elements and the current distribution principle. The signal-to-noise ratio of the block is from 50 to 200. The system is capable of handling up to 40 sensors with a measurement accuracy of 0.2%. Orig. art. has: 7 formulas and 3 figures.

TITLE: Microanalyzer for thin specimens

10 -
JOURNAL: Priboi, tekhnika eksperimenta, no. 1, 1965, 189-191

TOPIC TAGS: microanalyzer, structural analysis

ABSTRACT: An x-ray microanalyzer (MA) intended for structural analyses of microareas of thin (2000 Å) foils is described. The MA is built into a desk-type BS-242 electron microscope ("Tesla," Czechoslovakia) whose resolution is up to 30 Å and enlargement, 100-30,000; the picture can be observed on a 60x60-mm screen. The MA sensitivity can be evaluated on the basis of this data: with a 170-Å sprayed nickel film, a 1.5-μ probe diameter, 2×10^{-7} amp probe current, and a 4-kv accelerating voltage, the intensity of the K-line of nickel was measured with quartz crystal with 100%. For a thick pure-Ni specimen, other things being equal, the counting rate was 780 ppm. Orig. art. has: 3 figures.

TITLE: Peculiarities of ferroelectric phase transitions in solid solutions of the
system $\text{Na}_{0.5}\text{Bi}_{0.5}\text{TiO}_3$ -- PbTiO_3

SOURCE: Fizika tverdogo tela, v. 6, no. 3, 1964, 790-795

TOPIC TAGS: ferroelectric, phase transition, solid solution, Vegard law, dielectric polarization, crystal lattice structure

ABSTRACT: The authors' study stems from lack of information on the effect of diffusion of phase transitions on ferroelectric properties and from disagreement concerning the causes of the relaxation nature of dielectric polarization observed in ferroelectrics with diffused phase transitions. While investigating the dielectric properties and crystal structure in the system $\text{Na}_{0.5}\text{Bi}_{0.5}\text{TiO}_3$ -- PbTiO_3 , the authors discovered a number of relationships. Their studies confirm the view that the diffusion of ferroelectric phase transitions declines with

Card 1/2

ACCESSION NR: APL019840

increase in spontaneous polarization and spontaneous deformation of the solid solutions. At room temperature, the boundary between rhombohedral and tetragonal phases lies in the region of 0-10% PbTiO_3 . The dependence of unit-cell volume on component concentrations deviates considerably from the Vegard law. The Curie point of the examined solid solutions depends in nonlinear fashion on the concentration of PbTiO_3 , reaching a minimum at a content of about 10 mol/%. 1

On the Mechanism of Magnetization of Ferromagnetics. M. Shiroldkov (Zhur. Eksper. Teori. Fiziki, 1945, 15, (1/2), 57-76). - [In Russian.] The mechanism of magnetization for the simple case of a crystal having one axis of easy magnetization is investigated, on the basis of the Bloch-Landau-Lifshitz model. Analysis of the solutions of the differential equations which determine the distribution of the orientation of spins in a ferromagnetic, leads to the conclusion that in the case of an external field parallel to the axis of easy magnetization (which is the only case H. considers), the magnetization mechanism consists in the growth of the domains parallel to the field at the expense of those anti-parallel to it. In the case of very large fields the processes in intermediate layers play an important part. The existence of nuclei of magnetic reversal for any field is deduced from the theory. - N. H. V.

62. Theory of particles of spin 2. M. YA. SOKOLOV, *J. Exp. Theor. Phys., USSR*, 19, 481-6 (June, 1949) in Russian.

It is shown that a particle of spin 2 is not possessed of a kinematic electromagnetic dipole moment, yet of quadrupole and octupole moments active in radiation and not vanishing in the relativistic limiting case. Calculations show that the effective cross-section in optical scattering of the spin 2 particle grows indefinitely and at an extraordinary rate, as the frequency of the scattered light rises. As the optical scattering on elementary particles depends essentially on the character of the electromagnetic moment of the scatterer, this result points to the fact that the spin 2 particle possesses e.m. moments of order > 2 . [As summarized by Heiter and Ma, Abstr. 140 (1941). The calculation is based on the relativistic wave equations of the spin 2 particle in an external magnetic field, as given by Fierz and Pauli (Abstr. 44 (1940)), which show the absence of a kinematic dipole moment, whereas the detection of the true character of the moments uses Ginsburg's method (Abstr. 2145 (1945)) of investigation of the directed radiation of a particle uniformly moving through a medium (Cherenkov effect). PERIODICAL:
ABSTRACT:

Investigation is confined to an ideal polycrystal, i.e. heterogeneity of the interior voltages, electric fields and the crystalline structure are neglected. It is assumed that the crystallographical axis of the individual crystal particles are distributed chaotically, but that the sample in its entirety was previously polarized, that the vector of spontaneous polarization of each crystal particle shows that of the possible equivalent directions which form the smallest angle with the direction of the resulting polarization of the sample. On this basis those results may be used as were obtained for a monocrystal. Computation of the dielectric and piezoelectric properties of a polycrystalline sample is reduced to simple averaging. The tensors of the dielectric constants and the piezomoduli of the polarized ceramic of BaTiO_3 are computed for all three seignette-electric phases. It is of advantage to compute the tensors of the piezoelectric moduli by means of a special form of the tensor of the voltages σ_{ik} in an x-, y-, z-coordinate system, which is connected with the sample as a whole. Besides,

TITLE: Effect of an internal electric field on diffusion of impurities in semiconductors

SOURCE: Fizika tverdogo tela, v. 7, no. 11, 1965, 3356-3362

TOPIC TAGS: ^{21, 44, 55} semiconductor theory, electric field, metal diffusion

ABSTRACT: This paper gives a theoretical analysis of the effect which an internal electric field generated by ionized impurity particles and current carriers has on the distribution of impurity concentration in semiconductors. It is assumed that the coefficient of diffusion is independent of concentration. The analysis is based on an approximate solution of the diffusion equation together with the Poisson equation. The calculated concentration profiles are compared with experimental data on diffusion of antimony into germanium. It is shown that when surface concentrations

Card 1/2

0901 2048

L 6412-66

ACC NR: AP5027416

are comparable to or greater than the concentration of current carriers, where the field effect becomes noticeable, the distribution of impurity atoms differs from the well known expression (*circled p 3356*) corresponding to diffusion from a constant source without regard to the field. The results may be extended to the case of acceptor diffusion into intrinsic and extrinsic semiconductors. Curves are given for α as a function of surface concentration for intrinsic semiconductors and for those predoped with donors and acceptors. In conclusion, the authors are grateful to V. S. Metrikin and V. M. Maslova for assistance in carrying out the numerical calculations on a computer. Orig. art. has: 4 figures, 24 formulas.

TITLE: Estimate of oxygen content in germanium and silicon films obtained by
 vacuum deposition

SOURCE: Zhurnal fizicheskoy khimii, v. 39, no. 10, 1965, 2573-2576

TOPIC TAGS: oxygen, epitaxial growing, germanium, silicon, metal vapor deposition,
 SEMICONDUCTING FILM

ABSTRACT: The determination of the oxygen content in evaporated germanium and silicon
 films was made in two steps: first the amount of oxygen adsorbed on pure Ge and Si
 surfaces during the deposition of a single monolayer was calculated, then the volume
 oxygen concentration was found by multiplying by the number of monolayers per centi-
 meter of thickness of the film. Oxygen concentrations calculated for various deposi-
 tion rates and substrate temperatures in Ge and Si films grown in the $[100]$ direction
 are tabulated. The calculations were made for an oxygen pressure $p = 10^{-6}$ mm Hg; in
 order to obtain the concentration at other pressures p , it suffices to multiply the
 tabular value by $10^6 p$. The results are applicable to estimates of oxygen content
 in Ge films grown in the $[110]$ direction, and in Si films grown in the $[110]$ and
 $[111]$ directions. Certain conclusions are drawn regarding the conditions of growth
 of epitaxial films. Orig. art. has: 2 tables and 6 formulas.

TITLE: Influence of internal electric field on simultaneous diffusion of impurities in semiconductors

SOURCE: Fizika tverdogo tela, v. 3, no. 12, 1966, 3467-3473

TOPIC TAGS: semiconductor impurity, physical diffusion, hf transistor, germanium semiconductor, crystal effect

ABSTRACT: In view of the importance of simultaneous diffusion of two components of semiconductors to the manufacture of high-frequency transistors and similar devices, the authors investigate theoretically the influence of the internal electric field on simultaneous diffusion of donors and acceptors in an intrinsic semiconductor. The mathematical analysis yields a set of formulas and theoretical curves for the distribution of the donor concentration in a diffusion layer. The theoretical results were compared with experimental data obtained for the simultaneous diffusion, at 795C, of indium and antimony in germanium, using In^{114} and Sb^{124} as radioactive tracers. The distribution of the donors and acceptors was determined by successive removal of layers. The results have shown that the donors have little influence on the diffusion of acceptors, but the effect of acceptors on the diffusion of donors is

Card 1/2

ACC NR: AP7005829

appreciable. This is due to differences in the diffusion coefficients of the two substances. The deceleration of the donors increases the increasing acceptor concentration. For the same surface concentration of the acceptors, the influence of the acceptors on the donor diffusion is greater when the donor concentration is low. Some discrepancies between the theoretical and experimental data were observed, and these are attributed to formation of defects. Orig. art. has: 3 figures, 16 formulas, and 1 table.

TITLE: Infectivity of total RNA recovered from new-born mice infected with Cox-
sackie A-10 virus

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 60, no. 8, 1965,
89-92

TOPIC TAGS: virus, nucleic acid, ribonucleic acid, desoxyribonucleic acid, enzyme,
infective disease, nervous system disease

ABSTRACT: Infectious RNA was extracted from the carcasses of new-born mice infected
with Coxsackie A-10 virus. It was found that infectivity of the RNA preparations,
as determined by % deaths of mice infected, was significantly higher in subcuta-
neous inoculations than in intraperitoneal (95% in s.c., 62% in i.p.). This dif-
ference is attributed to the presence of RNA-ase in the peritoneal fluid. To de-
termine if the active element in the preparations was RNA itself or some contami-
nant, the preparations were treated with nucleases. The results indicated that it
is indeed the RNA which is responsible for the infectivity since the RNA prepara-

Card 1/2

L 3918-66

ACCESSION NR: AP5023552

3

tions treated with DNA-ase and whole virus suspensions treated with RNA-ase produced mortalities of 83% and 100%, respectively, as compared to 0.18% with RNA-ase treated RNA preparations. It was also found that bentonite stabilizes the RNA solutions since without it the preparations lost their infectivity after 24 hour storage at 4°C. This is attributed to the ability of bentonite to inactivate RNA-ase. Although the present investigation has shown the infectivity of total RNA, it is not yet clear what role, if any, is played by cellular RNA and protein, whether RNA from purified virus is infectious, or which of the ribonucleic acids constituting total RNA are infectious and which are not. Abstract : In experiments on dogs and rabbits the administration of
the dysenteric antigen (endotoxin of Flexner's bacillus
or vaccine) intravenously or into the lumen of the intes-
tine, or into its blood vessels, led to excitation of
the respiratory movements and to an insignificant

elevation of the arterial pressure. Following antigenic stimulation of the interoceptors of the small intestine an insignificant constriction of the blood vessels, a brief depression of peristalsis and a fall of the musculature tonus occurred in the large intestine. The threshold of excitability of the baroreceptors of the small intestine decreased to a greater extent than that of the large intestine i.e., the excitability of the receptors of the intestine to mechanical stimulation increased following contact with the antigen injected into the blood.

TOPIC TAGS: polyurethane, crystal lattice, glycol, isocyanate, ~~polymer~~
crystallization, copolymerization, molecular weight

ABSTRACT: The crystallization capacity and morphological structural types as a function of the chemical composition of polyurethane has been studied. The crystalline lattice of polyurethane depends on the initial isocyanate and glycol structures. The crystallization capacity of polyurethane drops with an increase in the polyester molecular weight up to 1000. In the case of polymers with a polyester base and molecular weight above 1000, the polyurethane could crystallize. However, in this case the crystalline lattice structure does not depend on the diisocyanate structure but only on the polyester structure. The degree of

TITLE: Comparative thermo-magnetic treatment in direct and alternating fields
PERIODICAL: Referativnyy zhurnal, Elektrotekhnika i energetika, no.9, 1962, 1, abstract 9 B4. (Materialy nauchn. konferentsiy. Izhevskiy s.-kh. in-t, no.8, 1961, 65-70).
TEXT: Studies were made of the effects of thermo-magnetic treatment, at a field strength of 50 oersted, on the magnetising curve of a specimen strip of transformer steel sheet and on a nickel wire specimen. It was established that for nickel the maximum permeability increases by 5% for thermo-magnetic treatment in a d.c. field, and by 4% if a 50 c.p.s. field is applied: for transformer sheet the increase was 18% and 30% respectively. An attempt is made to explain the different results obtained in a d.c. and an a.c. field by utilizing the hypothesis of Shur and Glyazer on the new structural state

TITLE: Electric properties of "Varikond" films with square hysteresis loops ⁵⁵ Report, Fourth All-Union Conference on Ferro-electricity held at Rostov-on-the Don 12-16 September 1964 ⁴⁴

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 11, 1965, 2104-2106

TOPIC TAGS: ^{15, 14} ferroelectric material, ceramic material, ceramic film, Curie point, dielectric constant, nonlinear effect, electric polarization, hysteresis loop

ABSTRACT: In an effort to obtain a ^{15, 14} ferroelectric ceramic with a highly nonlinear dielectric constant and a nearly rectangular dielectric hysteresis loop, the authors have investigated materials with a nearly cubic rhombohedral perovskite structure and have synthesized by undisclosed techniques a (possibly barium titanate base) ceramic of undisclosed composition with they call "VK-5" ¹⁵ and which has the following properties: Curie point, above 200°C; coercive field ¹⁶ 5-7 kV/cm, total polarization, 18-20 $\mu\text{C cm}^2$; resistivity, 10^{12} ohm cm at 100°C; nonlinearity factor (ratio of maximum to low-field dielectric constant), 20-50; and hysteresis loop squareness ratio (T.N. Verbitskaya, L.M.Aleksandrova, and L.S.Sinityna, Izv. AN SSSR. Ser. fiz., 24, No. 10, 1291 (1960)), 0.85-0.94. Disadvantages of this material are its high coercive and

Card 1/2

L 7832-bb

ACC NR: AP5028131

control fields. In an effort to eliminate these disadvantages, thin (5 to 100 μ) films of VK-6 were produced by an undisclosed technique and their ferroelectric properties were investigated. The Curie points, weak-field dielectric constants, squareness ratios, and saturation polarizations were approximately the same for the thin films as for the bulk material. The maximum dielectric constant was reduced from 2×10^4 for the bulk material to 10^4 for the 5-10 μ films, and the nonlinearity factor was therefore correspondingly reduced. The potential at which the dielectric constant was maximum, however, was reduced from 250 V for the bulk material to 10-20 V for the 5-10 μ films, and the saturation voltage was reduced from 600-800 V to 60-100 V. The pulse amplitude controlling switching was 30-60 V for the 10 μ films, and the switching time on a 10 ohm line was 0.3-0.7 μ sec. It is concluded that thin films of VK-6 can be produced which retain the high nonlinearity and hysteresis loop rectangularity of the bulk material and have considerably reduced controlling and switching voltages. STRUCTURE OF A 'MAN-MACHINE' COUPLING IN A SYSTEM OF GROUP PROGRAMMED INSTRUCTIONS ON A DIGITAL COMPUTER

SOVR. R. VUZ. Radiotekhnika, v. 7, no. 5, 1964, 556-562

TOPIC TAGS: student teaching, digital computer teaching, ^{16C}programed teaching

ABSTRACT: The coupling between a 200-student group and a "Minsk"-type digital computer is considered in a teaching-learning "combined" system which includes programed textbooks, texts, and a universal noiseless multichannel computer. Each student has a benchboard with a keyboard for setting up the exercises and program and a signal register supplying the computer's recommendations. The computer analyzes the student's answer, evaluates it, and issues a corresponding instruction or recommendation. The coupling system (consisting

Cord 1/2

L 25753-65

ACCESSION NR: AP5002036

of Soviet equipment described in some detail) comprises a switch, a distributor, and a buffer storage. The switch is intended for sequential connection of bench-board code trunks to the computer and for connecting the computer to the bench-boards. The distributor changes the switch operation from input to output and vice versa. The buffer storage holds the recommendation code during the time of decoding of the benchboard number by the switch. A medium-speed (about 1000 operations per sec) machine is required. Orig. art. has: 6 figures and 1 table.

parison with other compds. contg. conjugate C=C and C=O bonds, the assignments are made. C=C, I 1567, II 1556, III 1563; C=O, I 1660, II 1653, III 1647; C=N, I 1770, II 1766, III 1737. The C=C and the C=O frequencies are distinctly lower in azlactones than in ketones and ethylenic hydrocarbons; this indicates presence of structures

hand, the CN frequency is higher by 85-120 cm^{-1} than the usual 1650; this indicates some extent of triple bonding, that is occurrence of structures of the type of an inner salt with quadrivalent pos. N and univalent neg. O,

(over)

is in keeping with the case of splitting along C=O. As compared with C₁₁a, the frequencies 1508 and 1582 are much more intense in azlactones, becoming comparable to 1607; this shift of intensities is evidently linked with the presence of conjugation. Occurrence of the C:N frequency 1717 in IV, along with C:C 1635 and C:O 1659, demonstrates amide-imide tautomerism

of the anion resulting from hydrolysis of III in alk. soln. The high value of the CN frequency is explained, as in azlactones, by its partly triple-bond character, owing to

occurrence of the structure

corresponding resonance energy gain detg. stabilization of the energetically less favored imide form. N. T.

TITLE: Some problems encountered in investigating "optronic" circuits /Report, Fourteenth All-Union Conference on Luminescence (Crystal Phosphors) held at Riga, 16-23 Sept. 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no.9, 1966, 1530-1532

TOPIC TAGS: electroluminescence, photoconductor, flip flop circuit, electroluminescence panel

ABSTRACT: The "optronic" circuit discussed in this paper consists of an electroluminescence cell and a photoconductor connected in series and with optical feedback between them. Such a system can operate in one of three regimes, depending on the characteristics of the electroluminescence cell and the photoconductor, the supply voltage, and the feedback constant: an amplifying regime, in which there is one stable equilibrium of low brightness: the optron regime, in which there are low- and high-brightness stable equilibria and an intermediate-brightness unstable equilibrium; and a self-excited regime, in which there is one high-brightness stable equilibrium. In this paper design equations are derived for this system on the assumptions that the brightness of the electroluminescence cell is proportional to the 3.39-th power

Adaptation of gastric interoceptors. V. M. Shirokaya (*J. Physiol. USSR*, 1951, 87, 608-613).—The action currents in the frog's vagus nerve were recorded in response to pressure changes in the stomach

caused by inflation of a small balloon. Slowly rising pressures of 0-90 mm. Hg. did not produce a nerve response but rapidly rising pressure caused a volley of impulses which showed rapid adaptation. Oscillating pressures produce a prolonged activity which showed little adaptation. The rate and amplitude of the electrical responses is related to the degree of stretching of the stomach.

TITLE: Heats of combustion and enthalpies of formation of some acetylenic amines

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 7, 1966, 1650-1652

TOPIC TAGS: acetylenic amine, heat of combustion, enthalpy of formation

ABSTRACT: The authors have prepared high-purity samples of the following acetylenic amines:

The heats of combustion of these amines were determined calorimetrically by a procedure described in the source. The values of the heats of

TITLE: Experimental use of antifriction polymer materials in locomotives

SOURCE: Moscow. Vsesoyuznyy nauchno-issledovatel'skiy institut zheleznodorozhnogo transporta. Trudy*, No. 267, 1963. Primeneniye polimerov v podvizhnom sostave zheleznykh dorog (using polymers in railroad rolling stock), 46-59

TOPIC TAGS: antifriction material, antifriction polymer, locomotive, plastics, metal polymer, wear, antifriction disc, floating collars

ABSTRACT: The authors have undertaken a study to determine means for meeting increased reliability and life span requirements of friction points in moving parts of trains, due to the rapid growth and increased speed of the railroad transport. The study concentrated on metal-polymer friction couplings. After laboratory and test stand experiments, a number of metal-polymer couplings were installed on locomotives for experimental use. Some of these materials were made completely of plastic others from metal components covered with an antifriction polymer layer. The authors list the results using the latter in various components, such as antifriction discs

Card 1/2

ACCESSION NR: AT4028413

of electric locomotives, floating collars of the main axles of steam locomotives, the slip rod collars of steam locomotives, the slip cover plates of locomotives, valves of steam locomotives, etc. on various rail lines of the Soviet Union. As a result of their investigations, the authors hope that in the immediate future, plastics will be substituted for nonferrous metals to a significant degree in railroad rolling stock and will thereby increase the operation of friction points of the moving parts. Orig. art. has: 11 figures and 5 tables.
